Utilities

=====

Name	---Author---	--Publication date--	Z390 version
1) UNREF	Melvyn Maltz	May 10th, 2007	V1.3.03b

1) UNREF

This program reads the PRN output file and produces an extract of the Symbol Table containing just the unreferenced labels.

There is a large exclude table which eliminates common labels like register equates and Z390 DSECTs.

There is a copy book included, UNREFUSR.CPY with a dummy entry. This should be used to add your own excludes, which will avoid the need to modify UNREF when it is refreshed.

See the UNREF.BAT file for usage.

SET PRNFILE= is the input file.

SET URFFILE= is the output file, the suffix .URF can be changed.

The UNREF program itself has 3 intentional unreferenced labels for verification.
